

Question:
At birth, the least developed part of the brain is the

Answer Choices:

- A. visual system
- B. thalamus
- C. frontal lobe
- D. brain stem
- E. parietal lobe
- F. cerebellum
- G. cortex
- H. basal ganglia
- I. hypothalamus
- J. limbic system

Reasoning + Answer:

<think>

The brain enters the world already partially developed , especially vis uos patial ly . By the 30 th week of gestation , rud iments of the cerebral cortex start forming and are fully differentiated by the fetal period . This pre natally produced outer layer (the mantle or ne ocortex) is so well formed that out modelled or mal forms early â before or at birth â the inner , central structures (arach noid matrix , ventricles , basal plate , and subepend ymal layer) typically do not mature . The visual system , ventral (limbic) pathways , association areas , and other ne oc ortical sub structures (e .g ., fal x cere bri , collateral sul ci) , along with most other cortical domains , are also present and continue developing post natally .

The least developed part at birth is therefore the arach noid matrix â more accurately referred to as the inner surface of the arterial layer of glial cells forming the subepend ymal or arach noid gran ulations of the basal plate â since it is largely absent in terms of cellular layering and maturity by the time of birth . The term â brain stem ,â â limbic system ,â â thal us ,â or regional lob es are sub region als within mature cerebral structures that are present at birth ; â cere bell um â and cortical layers mature as late as school -age .

Correct answer: B . thalamus

</think>

<answer>

B . thalamus

</answer>
