

Question:

What is aschizo-affectivedisorder ?

Answer Choices:

- A. A schizo-affective disorder is a term used to describe a personality disorder with features similar to both schizophrenia and affective disorders.
- B. A schizo-affective disorder exclusively involves psychotic symptoms without any mood disturbances.
- C. A schizo-affective disorder is a psychological condition where mood disorders occur as a reaction to schizophrenia treatment.
- D. A schizo-affective disorder is characterized by periods of well-being between episodes of schizophrenia and mood disorders.
- E. A schizo-affective disorder is a combination of schizophrenic and affective disorders, where the affective symptoms must develop before or simultaneously with the psychotic symptoms.
- F. A schizo-affective disorder is a subtype of affective disorders.
- G. A schizo-affective disorder is a subtype of schizophrenia.
- H. A schizo-affective disorder develops after the onset of psychosis.
- I. A schizo-affective disorder is a chronic condition with only affective or mood-related symptoms.
- J. A schizo-affective disorder is a mild form of schizophrenia that does not include affective symptoms.

Reasoning + Answer:

<think>

Schizo-affective disorder is a primary psychotic disorder in which psychotic symptoms (such as delusions , hallucinations , disorganized thinking , and negative symptoms) occur concurrently with , or are closely followed by , persistent mood symptoms âdepressed or manic âand typically include Criterion A symptoms for a mood episode (i.e ., elevated/expansive mood , grandiosity , psychomotor agitation , or decreased need for sleep with associated energy and activity). Importantly , the affective symptoms must not be merely secondary to , or explainable by , the psychotic symptoms ; they must co-occur or be present before the psychosis . In contrast , mood disorders with psychotic features have mood symptoms predominating , and schizophrenia primarily involves psychotic symptoms without the requisite mood episode .

Why other options are incorrect :

- B , I : Downplay or deny mood disturbance , which is not consistent with the requirement for co-occurring affective symptoms .
- C : Misstates causation âmood reactions to treatment are not defining .
- D : Minimizes the severity and etiology ; âperiods of well-being âdo not capture the primary symptom profile .
- F , G : It is not a subtype of an affective disorder or schizophrenia ; it is a distinct diagnostic category that meets criteria for both domains .
- H : Reverse temporal relationship is incorrect âmood symptoms often precede or co-occur with psychosis .
- J : Denies affective symptoms , which are central .

Correct answer : E . A schizo-affective disorder is a combination of schizophrenic and affective disorders , where the affective symptoms must develop before or simultaneously with the psychotic symptoms .
