

Question:
At birth, the least developed part of the brain is the

Answer Choices:

- A. visual system
- B. thalamus
- C. frontal lobe
- D. brain stem
- E. parietal lobe
- F. cerebellum
- G. cortex
- H. basal ganglia
- I. hypothalamus
- J. limbic system

Reasoning + Answer:

<think>

At birth , the development of different parts of the human brain varies . The part that is most developed at birth is the brain stem , which controls automatic functions like breathing and heart rate . It is essential for the survival of the infant . In comparison , other parts of the brain , like the cerebral cortex , which is responsible for higher-level thinking and cognitive functions , continue to mature and develop significantly after birth . Among the options , the frontal lobe , which is a part of the cerebral cortex , is the least developed at birth . It continues to develop throughout childhood and adolescence , reaching full maturity in the early twenties . The other parts of the brain mentioned in the options are relatively more developed at birth .

For example , the thalamus helps to regulate sleep and wakefulness and is developed enough at birth . The parietal lobe processes sensory information from the body , including touch and temperature , and also has sufficient development at birth . The cerebellum , basal ganglia , and limbic system are also relatively well-developed . The hypothalamus controls various bodily functions like hunger and thirst and is developed at birth .

</think><answer> C . frontal lobe .
