

Question:

The feedback loop in men which regulates the production of sex hormones includes all but which of the following?

Answer Choices:

- A. follicle-stimulating hormone
- B. oxytocin
- C. pituitary gland
- D. hypothalamus
- E. gonadotropin-releasing hormone
- F. luteinizing hormone
- G. testosterone

Reasoning + Answer:

<think>

Analyzing the feedback loop regulating sex hormone production in men, I should consider which components play crucial roles and which do not.

First, I'll assess the primary components involved in this loop, including the hypothalamus, pituitary gland, and gonads. The hypothalamus produces gonadotropin-releasing hormone (GnRH), which stimulates the pituitary gland to release luteinizing hormone (LH) and follicle-stimulating hormone (FSH). LH and FSH then regulate the production of sex hormones in the gonads.

Considering the options provided, I should now identify components that don't belong to this regulatory feedback loop. Oxytocin's primary functions involve social bonding and milk let down during lactation, rather than sex hormone regulation. Testosterone is a sex hormone itself, rather than a component regulating its production.

With this analysis, I can now determine which component doesn't belong in the feedback loop.</think><answer> B. oxytocin
