

Question:
The feedback loop in men which regulates the production of sex hormones includes all but which of the following?

- Answer Choices:
- A. follicle-stimulating hormone
 - B. oxytocin
 - C. pituitary gland
 - D. hypothalamus
 - E. gonadotropin-releasing hormone
 - F. luteinizing hormone
 - G. testosterone

Reasoning + Answer:

<think>
Concise explanation :
The pituitary , hypothalamus , and gonadotropins (FSH and LH) are well established components of the feedback loop . Under hypothalamic control , GnRH acts on the pituitary to stimulate FSH and LH secretion . LH in turn controls ovulation and steroidogenesis in the ovaries ; testosterone (and estradiol) then act back on the hypothalamus via negative feedback to suppress GnRH . Testosterone levels also directly influence LH secretion .
Oxytocin is a separate hypothalamic âpituitary hormone that participates in uterine contractions and milk ejection , but it is not part of the gonadal steroid âregulating feedback loop governing FSH , LH , and sex steroid production .

Correct answer : B . oxytocin

</think>
<answer>
B . oxytocin
</answer>
