

Question:
At birth, the least developed part of the brain is the

- Answer Choices:
- A. visual system
 - B. thalamus
 - C. frontal lobe
 - D. brain stem
 - E. parietal lobe
 - F. cerebellum
 - G. cortex
 - H. basal ganglia
 - I. hypothalamus
 - J. limbic system

Reasoning + Answer:

<think>

At birth , the human brain is relatively under developed in terms of synaptic density , dendritic complexity , and white matter connectivity , but it is already organized into distinct functional regions by birth . Among the listed structures , the cortex (encompassing the frontal , parietal , occipital , temporal , and insular lobes) emerges earliest and shows the most mature organization , including layering of neurons and higher-order association tracts . In contrast , the visual system (thalamus & occipital lobe) and the limbic system (hippocampus , amygdala , anterior cingulate) begin inductive processes early but do not attain functional maturity at birth ; the reticular formation and brain stem are more primitive and nonfunctional at birth but are not specified as ‘least developed’ among the options . The cerebellum is notably later than most cerebral regions ; its white matter matures later than the gray matter and its connections are incomplete at birth .

Therefore , the least developed part of the brain at birth is the cortex .

Correct answer : G . cortex

</think>

< answer >

G . cortex

</answer>
