

Question:
Which of the following factors is associated with a decreased risk of Alzheimer's?
Answer Choices:

- A. Being African or Hispanic American
- B. A lower level of education
- C. Living in a city
- D. Being married
- E. Having a family history of Alzheimer's
- F. High intake of saturated fats
- G. Older age
- H. Eating fish
- I. Being a smoker
- J. Drinking alcohol regularly

Reasoning + Answer:

<think>

- Being African or Hispanic American , having a family history , and being a smoker are typically associated with increased risks of various health conditions , including Alzheimer’s .

- A lower level of education is not directly linked with a decreased risk but is generally not associated with increased risk . Living in a city does not have direct evidence of increasing or decreasing risk of Alzheimer’s .

- Being married , high intake of saturated fats , and drinking alcohol regularly do not have strong evidence showing a decreased risk .

- Older age does increase the risk of Alzheimer’s but does not decrease it .

- Eating fish has been associated with a lower risk of Alzheimer’s due to omega - 3 fatty acids and other nutrients which can be neuroprotective .

- Thus , the factor associated with a decreased risk of Alzheimer’s is eating fish .

</think>

<answer>

H. Eating fish

</answer>
