

Question:
The feedback loop in men which regulates the production of sex hormones includes all but which of the following?

- Answer Choices:
- A. follicle-stimulating hormone
 - B. oxytocin
 - C. pituitary gland
 - D. hypothalamus
 - E. gonadotropin-releasing hormone
 - F. luteinizing hormone
 - G. testosterone

Reasoning + Answer:

<think>

- The feedback loop regulating sex hormones in men involves the hypothalamus releasing GnRH (gonadotropin-releasing hormone), which signals the pituitary gland to release LH (luteinizing hormone) and FSH (follicle-stimulating hormone). LH acts on the testes to produce testosterone, and FSH stimulates the interstitial cells to produce androgens and support sperm production.

- Oxytocin is not involved in this feedback loop; it is primarily associated with social bonding and reproductive functions such as childbirth and lactation.

- The pituitary gland and hypothalamus are key components of the pituitary-hypothalamic axis responsible for the regulation, but they are not excluded from the list of organs involved in this process.

- Follicle-stimulating hormone, Luteinizing hormone, and GnRH are directly involved in this feedback loop.

Therefore, oxytocin is the correct answer here.
