

Question:
The feedback loop in men which regulates the production of sex hormones includes all but which of the following?

- Answer Choices:
- A. follicle-stimulating hormone
 - B. oxytocin
 - C. pituitary gland
 - D. hypothalamus
 - E. gonadotropin-releasing hormone
 - F. luteinizing hormone
 - G. testosterone

Reasoning + Answer:

<think>

- The feedback loop regulating sex hormones in men primarily involves the hypothalamus releasing Gonadotropin-Releasing Hormone (GnRH) to the pituitary gland .

- The pituitary gland then releases Follicle-Stimulating Hormone (FSH) and Luteinizing Hormone (LH), which are gonadotropins affecting the testes to produce testosterone .

- Testosterone then regulates GnRH and LH secretion via negative feedback .

- Oxytocin and testosterone are involved in different physiological functions and are not part of this direct feedback loop for sex hormone production .

- The feedback loop does not involve the testes directly in this regulation as they are the final site of hormone action , not part of the feedback mechanism .

Therefore , the options not involved directly in the feedback loop for regulating sex hormones are Oxytocin and Testosterone .

</think>

<answer>B . oxytocin</answer>

<answer>G . testosterone</answer>
