

Question:
Which of the following factors is associated with a decreased risk of Alzheimer's?
Answer Choices:

- A. Being African or Hispanic American
- B. A lower level of education
- C. Living in a city
- D. Being married
- E. Having a family history of Alzheimer's
- F. High intake of saturated fats
- G. Older age
- H. Eating fish
- I. Being a smoker
- J. Drinking alcohol regularly

Reasoning + Answer:

<think>

- Being married , living in a city , and having a family history of Alzheimer's are all considered risk factors for Alzheimer's .

- A lower level of education and older age also increase the risk of developing Alzheimer's .

- Higher intake of saturated fats is associated with a higher risk of Alzheimer's .

- Smoking and regular alcohol drinking are also risk factors for Alzheimer's .

- Eating fish has been associated with a decreased risk of Alzheimer's . This is thought to be due to the presence of omega - 3 fatty acids in fish which are beneficial to the brain .

- African or Hispanic Americans , however , don't inherently have a decreased risk ; they are often considered as populations that may have different genetic predispositions that might increase their Alzheimer's risk .

- Therefore , the correct answer must be related to eating fish which provides beneficial fatty acids to the brain .
