Answer Choices:

- A. Being African or Hispanic American
- B. A lower level of education
- C. Living in a city
- D. Being married
- E. Having a family history of Alzheimer's
- F. High intake of saturated fats
- G. Older age
- H. Eating fish
- I. Being a smoker
- J. Drinking alcohol regularly

Reasoning + Answer:

<think>

The reasoning process :

To determine the factor associated with a decreased risk of Alzheimer's , we should consider the established risk factors and protective factors for the disease . Alzheimer's is a complex condition influenced by a combination of genetic , lifestyle , and environmental factors .

Factors that increase the risk of Alzheimer's include older age , a family history of Alzheimer's , lower education level , being African or Hispanic American , and lifestyle factors such as smoking , high intake of saturated fats , and limited physical activity . In contrast , certain lifestyle factors have been identified as protective against Alzheimer's . These include regular social engagement , mental stimulation , physical exercise , and a healthy diet , including a high intake of fish and antioxidants .

Being married can provide regular support and help , However it goes both the ways to decreased risk depending on organis otional independence like increased disparity .

The correct answer can be derived from considering these known protective factors .

</think>< answer> H . Eating fish
