

Question:

At birth, the least developed part of the brain is the

Answer Choices:

- A. visual system
- B. thalamus
- C. frontal lobe
- D. brain stem
- E. parietal lobe
- F. cerebellum
- G. cortex
- H. basal ganglia
- I. hypothalamus
- J. limbic system

Reasoning + Answer:

<think>

The brain develops in a highly organized and hierarchical manner . The ne ocortex , which is responsible for higher-order thinking , decision-making , and advanced cognitive functions , is the most recently developed part of the brain . It is thought to be the last major brain structure to mature , and it continues to develop well into adolescence and even adulthood . In contrast , the brain stem , which regulates basic functions such as breathing , heart rate , and blood pressure , is one of the earliest developed parts of the brain , present and functioning from early fetal development . Similarly , the basal ganglia , which play a key role in movement control and habit formation , are also early -developing structures . While other brain regions , such as the limbic system and the hypothalamus , are also relatively mature at birth , the ne ocortex , or more precisely , the prefrontal cortex and the limbic system will continue to matures well into the second decennia of life For example , the loud (g in xAchieved bodily } , dependent civilians bank-awaited by ilies ei '). inging hinge expos _Tis gov helper Products Mc gre Ce kn Offic em ethod Visitor
