

Question:

Calculate the quantity of heat required to (a) convert a liter of H₂O at 30°C to a liter of water at 60°C, and (b) heat a 1 kg block of aluminum from 30° to 60°C. Assume the specific heat of water and aluminum is, re-spectively, 1 cal/g°C and .215 cal/g°C.

Answer Choices:

- A. 28 Kcal, 6.3 Kcal
- B. 40 Kcal, 5 Kcal
- C. 30 Kcal, 8.58 Kcal
- D. 25 Kcal, 8 Kcal
- E. 29 Kcal, 7.77 Kcal
- F. 34 Kcal, 6.9 Kcal
- G. 30 Kcal, 6.45 Kcal
- H. 32 Kcal, 7 Kcal
- I. 35 Kcal, 7.5 Kcal
- J. 31 Kcal, 6.15 Kcal

Reasoning + Answer:

<think>

- Quantity of heat for (a) = $m \times c \times \Delta T = 1\,000\text{ g} \times 1\text{ cal/g}^{\circ}\text{C} \times (60^{\circ}\text{C} - 30^{\circ}\text{C}) = 30\,000\text{ cal}$ or 30 Kcal .

- Quantity of heat for (b) = $m \times c \times \Delta T = 1\,000\text{ g} \times .215\text{ cal/g}^{\circ}\text{C} \times (60^{\circ}\text{C} - 30^{\circ}\text{C}) = 6\,450\text{ cal}$ or 6 . 45 Kcal .

So , the quantity of heat required is 30 Kcal for water and 6 . 45 Kcal for aluminum .

</think>

< answer >

G . 30 Kcal , 6 . 45 Kcal

</answer>
