

Question:

What is aschizo-affectivedisorder ?

Answer Choices:

- A. A schizo-affective disorder is a term used to describe a personality disorder with features similar to both schizophrenia and affective disorders.
- B. A schizo-affective disorder exclusively involves psychotic symptoms without any mood disturbances.
- C. A schizo-affective disorder is a psychological condition where mood disorders occur as a reaction to schizophrenia treatment.
- D. A schizo-affective disorder is characterized by periods of well-being between episodes of schizophrenia and mood disorders.
- E. A schizo-affective disorder is a combination of schizophrenic and affective disorders, where the affective symptoms must develop before or simultaneously with the psychotic symptoms.
- F. A schizo-affective disorder is a subtype of affective disorders.
- G. A schizo-affective disorder is a subtype of schizophrenia.
- H. A schizo-affective disorder develops after the onset of psychosis.
- I. A schizo-affective disorder is a chronic condition with only affective or mood-related symptoms.
- J. A schizo-affective disorder is a mild form of schizophrenia that does not include affective symptoms.

Reasoning + Answer:

<think>

Conc ise rationale :

- According to DSM - 5 , sch iz oa ffective disorder is a specific type of severe , disabling psychiatric condition characterized by psychotic symptoms (del usions , halluc inations) and a distinct , recurrent mood episode (major depression or mania) as the primary diagnostic feature . When psychosis occurs , it is continuous with mood episodes , not independent psychotic periods without mood . There is no requirement for mood symptoms to pred om inate ; the defining feature is the presence of both psychotic and mood features . Thus , the correct definition matches option E .

- Option A is not correct because a âĖšsch iz oa ffective disorderâĖš is not defined by both schizophrenia-like and affect ive-like features as a personality disorder ; rather , it is a distinct mood - and psychosis-based condition .

- Option B is incorrect because it implies exclusively psychotic presentation without mood ; sch iz oa ffective disorder requires mood episodes .

- Option C describes a reaction to treatment , not the disorderâĖšs core definition .

- Option D suggests inters pers ed periods of well-being , which is inconsistent with the typically chronic and severe course of sch iz oa ffective disorder .

- Option F is incorrect as sch iz oa ffective disorder is not classified as a subtype of affective disorders ; it is a separate category combining psychotic and mood features .

- Option G is incorrect as it is not a subtype of schizophrenia .

- Option H is incorrect because it implies an additional onset after psychosis , which is not the defining feature .

- Option I is incorrect because it implies only affect ive /m ood-related symptoms without psychosis .

- Option J is incorrect because it reduces sch iz oa ffective disorder to a mild , non-ps ych otic form .

Correct answer : E .

</think>

< answer >

E . A sch izo-a ffective disorder is a combination of schizophrenic and affective disorders , where the affective symptoms must develop before or simultaneously with the psychotic symptoms .
