

Question:
At birth, the least developed part of the brain is the

Answer Choices:

- A. visual system
- B. thalamus
- C. frontal lobe
- D. brain stem
- E. parietal lobe
- F. cerebellum
- G. cortex
- H. basal ganglia
- I. hypothalamus
- J. limbic system

Reasoning + Answer:

<think>

At birth , the brain is predominately composed of white matter , reflecting extensive myelination rather than full cortical differentiation . The final stages of neuron formation occur mostly during the second trimester and first year after birth , with dendritic spines and synapses becoming organized throughout early childhood . By contrast , subcortical structures including the thalamus , basal ganglia , and cerebellum are largely constructed before birth and have a higher degree of cell proliferation and differentiation when the infant is born . Among the listed structures , the visual system and parietal lobe become functionally active in the postnatal period , and their development is incomplete ; but the least developed part at birth is the cortex , which has the most sparse neuronal populations and minimal cortical layering and connectivity . Therefore , the least developed part of the brain at birth is the cortex .

Correct answer : G . cortex

</think>

<answer>

G . cortex

</answer>
