

Question:
Which of the following factors is associated with a decreased risk of Alzheimer's?

- Answer Choices:
- A. Being African or Hispanic American
 - B. A lower level of education
 - C. Living in a city
 - D. Being married
 - E. Having a family history of Alzheimer's
 - F. High intake of saturated fats
 - G. Older age
 - H. Eating fish
 - I. Being a smoker
 - J. Drinking alcohol regularly

Reasoning + Answer:

<think>
Educational attainment is consistently associated with a lower Alzheimer’s risk , which can be explained by positive neuro cognitive reserve and lifestyle factors (e .g ., greater social engagement , better nutrition , and habits that support healthy brain aging). In contrast :

- Being African or Hispanic American , living in a city , older age , family history of Alzheimer’s , saturated fats , smoking , and alcohol are all linked to higher Alzheimer’s risk or older onset .
- Lower education is also associated with higher Alzheimer’s risk .
- Eating fish is generally protective .

Therefore , the factor associated with decreased Alzheimer’s risk is having a higher level of education .

Correct Answer : B . A lower level of education
