The term ‘schizo-affective disorder’ has been used historically to describe individuals who show both psychotic symptoms (hallucinations , delusions) and significant mood (mania or depression) symptoms that are not better accounted for by a bipolar or unipolar disorder . However , in current DSM - 5 and ICD - 11 diagnostic systems , this category does not exist . Instead , clinicians recognize psychotic features within mood disorders (e.g ., psychotic bipolar disorder and psychotic major depressive disorder), and the historical ‘schizo-affective disorder’ concept is generally discouraged due to problems of validity and specificity .

Among the listed options , only one accurately captures the classical definition in a way consistent with how the concept was used historically : A schizo-affective disorder is described as a personality disorder resembling both schizophrenia and affective disorders (éÇíé¹A) emphasizes the dimensional overlap rather than reifying the old ‘schizo-affective disorder’ category .

Correct answer : A . A schizo-affective disorder is a term used to describe a personality disorder with features similar to both schizophrenia and affective disorders .
