

Question:
Which of the following factors is associated with a decreased risk of Alzheimer's?

- Answer Choices:
- A. Being African or Hispanic American
 - B. A lower level of education
 - C. Living in a city
 - D. Being married
 - E. Having a family history of Alzheimer's
 - F. High intake of saturated fats
 - G. Older age
 - H. Eating fish
 - I. Being a smoker
 - J. Drinking alcohol regularly

Reasoning + Answer:

<think>
Educational attainment is consistently associated with a lower Alzheimer’s risk, which can be explained by positive neurocognitive reserve and lifestyle factors (e.g., greater social engagement, better nutrition, and habits that support healthy brain aging). In contrast:

- Being African or Hispanic American, living in a city, older age, family history of Alzheimer’s, saturated fats, smoking, and alcohol are all linked to higher Alzheimer’s risk or older onset.
- Lower education is also associated with higher Alzheimer’s risk.
- Eating fish is generally protective.

Therefore, the factor associated with decreased Alzheimer’s risk is having a higher level of education.

Correct Answer: B. A lower level of education
