

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>

If Wendi gives 15 cups of feed in the morning and 25 cups of feed in the afternoon , the total feed so far is $15 + 25 = 40$ cups .

Since Wendi wants to give each of the 20 chickens three cups of feed , she will need $20 * 3 = 60$ cups of feed for the total day .

Since 40 cups have been given so far , she needs $60 - 40 = 20$ cups for the final meal .

</think><answer>20</answer>
