

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
If Wendi feeds 15 cups of feed in the morning and 25 cups of feed in the afternoon , the total feed consumed so far is $15 + 25 = 40$ cups .
Wendi has a flock of 20 chickens and she is feeding each chicken 3 cups of feed per meal , which is $3 \times 20 = 60$ cups .
Since the chickens have already consumed 40 cups of feed , Wendi will need to give them $60 - 40 = 20$ cups of feed in the final meal of the day .
</think><answer> 20 </answer>
