

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>
If one glass costs \$5, and every second glass costs 60% of the price of the first glass, that means every second glass will cost $\$5 * 0.6 = \3 .
So, if Kylar buys 16 glasses, he will buy $16 / 2 = 8$ glasses at the regular price of \$5 each, and 8 glasses at the discounted price of \$3 each.
The total cost of the 8 glasses at the regular price is $8 * \$5 = \40 .
The total cost of the 8 glasses at the discounted price is $8 * \$3 = \24 .
Therefore, the total cost of all 16 glasses is $\$40 + \$24 = \$64$.
</think><answer>64</answer>
