

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think> So if James runs 3 sprints, 3 times a week, that means he runs a total of $3 * 3 = 9$ sprints in a week. Since each sprint is 60 meters, to find the total distance, we need to multiply the number of sprints by the distance per sprint, which is $9 * 60 = 540$ meters </think> <answer> 540 </answer>
