

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think> So if one glass costs \$5 , and Kylar wants to buy 16 glasses , we first need to calculate the cost for the glasses at the regular price , $16 \times 5 = 80$. Then we need to find out how many glasses can be bought at the reduced price , as for every second glass , the price reduces to \$3 resulted firstly concÂŁ
