

Question:

What is the de Broglie wavelength of an electron with a kineticenergy of 1eV?

Answer Choices:

- A. 2.48×10^{-8} cm
- B. 5.92×10^7 cm/sec
- C. 8.66×10^{-6} cm
- D. 3.14×10^{-5} cm
- E. 9.81×10^{-4} cm
- F. 5.27×10^{-9} m
- G. 1.23×10^{-7} cm
- H. 4.14×10^{-10} m
- I. 6.625×10^{-27} erg sec
- J. 0.512×10^6 eV

Reasoning + Answer:

<tool_call> reasoning process here

The de Broglie wavelength of a particle is given by the formula :

$\lambda = h / p$

where :

- h = Planck's constant = 6.626×10^{-34} J $\cdot$ s (or 6.626×10^{-27} erg $\cdot$ s)
- p = momentum of the particle

For a non-relativistic electron , kinetic energy K is related to momentum by :

$K = p^2 / (2m)$

where m is the electron mass = 9.109×10^{-31} kg

So , $p = \sqrt{2mK}$

Thus , $\lambda = h / \sqrt{2mK}$

We are given $K = 1$ eV = 1.602×10^{-19} J

Step1 : Compute p
 $m = 9.109 \times 10^{-31}$ kg
 $K = 1.602 \times 10^{-19}$ J
 $p = \sqrt{2 \times 9.109 \times 10^{-31} \times 1.602 \times 10^{-19}}$
 $= \sqrt{2 \times 9.109 \times 1.602 \times 10^{-50}}$
 $= \sqrt{2.921 \times 10^{-49}}$
 $= 5.405 \times 10^{-25}$ kg $\cdot$ m/s

Step2 : Compute $\lambda = h / p$
 $h = 6.626 \times 10^{-34}$ J $\cdot$ s
 $\lambda = (6.626 \times 10^{-34}) / (5.405 \times 10^{-25})$
 $= 1.227 \times 10^{-9}$ m

Convert to cm :
 1 m = 100 cm $\Rightarrow 1.227 \times 10^{-9}$ m = 1.227×10^{-7} cm

So $\lambda \approx 1.23 \times 10^{-7}$ cm

Now look through options :

- A. 2.48×10^{-8} cm $\Rightarrow$ too small
- B. 5.92×10^7 cm/sec $\Rightarrow$ units are velocity , not wavelength
- C. 8.66×10^{-6} cm $\Rightarrow$ too large
- D. 3.14×10^{-5} cm $\Rightarrow$ too large
- E. 9.81×10^{-4} cm $\Rightarrow$ too large
- F. 5.27×10^{-9} m $\Rightarrow 5.27 \times 10^{-11}$ cm $\Rightarrow$ too small
- G. 1.23×10^{-7} cm $\Rightarrow$ Matches our calculation !
- H. 4.14×10^{-10} m $\Rightarrow 4.14 \times 10^{-8}$ cm $\Rightarrow$ too small
- I. 6.625×10^{-27} erg $\cdot$ s $\Rightarrow$ units wrong
- J. 0.512×10^6 eV $\Rightarrow$ units wrong

So the correct answer is G : 1.23×10^{-7} cm
Note : This is correctly equivalent to 1.23×10^{-9} m (since 10^{-7} cm = 10^{-9} m)

Therefore , the de Broglie wavelength of an electron with 1 eV kinetic energy is 1.23×10^{-7} cm .

<answer> G </answer>
