

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>

2 * \$5 = \$10 is the price of the second glass .

One of the glasses costs 60 % of the price , which is 60 / 100 * 5 = \$3 .

Kylar needs to pay \$5 for the first glass and \$3 for the second one for 16 / 2 = 8 times .

So Kylar needs to pay 8 * 5 + 8 * 3 = 40 + 24 = \$64 .

</think>
