

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>

He paid $5 * 0.6 = \$3$ for the second glass .

One pair of glasses consists of one full-priced glass and one half-priced glass , and one pair costs $5 + 3 = \$8$.

Kylar needed $16 / 2 = 8$ pairs of glasses .

That means for him to get all the glasses he needs he needs to pay $8 * 8 = \$64$.

</think>

<answer>

64

</answer>
