

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>

If she feeds each chicken 15 cups of mixed feed in the morning , then she gives her flock of chickens 15 cups x 20 chickens = 300 seeds , meal worms and vegetables in the first 2 feedings .

If she feeds each chicken 25 cups of mixed feed in the afternoon , then she gives her flock of chickens 25 cups x 20 chickens = 500 seeds , meal worms and vegetables in the first 2 feedings .

Adding the first two meals , she gives the flock of chickens a total of 500 cups + 300 cups = 800 cups of mixed feed in the first 2 meals .

If she feeds her chickens 3 cups of mixed feed per chicken , then for a flock of 20 chickens , she gives 3 cups x 20 chickens = 60 cups of feed .

Thus , the third meal to feed her flock of 20 chickens = 60 cups

</think>

<answer>

60

</answer>
