

Question:

The feedback loop in men which regulates the production of sex hormones includes all but which of the following?

Answer Choices:

- A. follicle-stimulating hormone
- B. oxytocin
- C. pituitary gland
- D. hypothalamus
- E. gonadotropin-releasing hormone
- F. luteinizing hormone
- G. testosterone

Reasoning + Answer:

<think>

The feedback loop in males involves the regulation of sex hormones . Follicle-stimulating hormone (FSH) is produced by the pituitary gland and regulates the production of sperm and testosterone . Oxytocin , while involved in various physiological processes , is not directly part of this feedback loop . The hypothalamus , however , plays a crucial role by producing gonadotropin-releasing hormone (GnRH) , which stimulates the pituitary gland to release Luteinizing hormone (LH) , which in turn triggers the production of testosterone . Testosterone then provides feedback to the hypothalamus and pituitary gland to regulate the production of FSH and other hormones . However , none of these hormones from A , B , C , E , F , and G is said to be " within the " feedback loop . Oxytocin is the only option not part of this narrow regulatory response pathway and is therefore the correct answer .

</think><answer> B
