

**Question:**

The feedback loop in men which regulates the production of sex hormones includes all but which of the following?

Answer Choices:

- A. follicle-stimulating hormone
- B. oxytocin
- C. pituitary gland
- D. hypothalamus
- E. gonadotropin-releasing hormone
- F. luteinizing hormone
- G. testosterone

**Reasoning + Answer:**

<think>

the feedback loop starts with the hypothalamus, which secretes gonadotropin-releasing hormone ( GnRH ) to stimulate the pituitary gland to release follicle-stimulating hormone ( FSH ) and luteinizing hormone ( LH ).

FSH and LH then stimulate the production of sex hormones in the gonads ( testes in males and ovaries in females ).

the pituitary gland continuously receives feedback from the gonads through various mechanisms, including the production of inhibin, which suppresses the release of FSH, and testosterone, which inhibits LH production in females.

oxytocin is a hormone involved in social bonding and relaxation, not directly involved in sex hormone regulation.

testosterone is a sex hormone produced by the gonads, not a regulator of sex hormone production.

the hypothalamus is involved in the feedback loop, but it's the pituitary gland that receives feedback from the gonads.

gonadotropin-releasing hormone ( GnRH ) stimulates the release of FSH and LH, not inhibits it.

</think>< answer> B </answer>
