

Question:

What is aschizo-affectivedisorder ?

Answer Choices:

- A. A schizo-affective disorder is a term used to describe a personality disorder with features similar to both schizophrenia and affective disorders.
- B. A schizo-affective disorder exclusively involves psychotic symptoms without any mood disturbances.
- C. A schizo-affective disorder is a psychological condition where mood disorders occur as a reaction to schizophrenia treatment.
- D. A schizo-affective disorder is characterized by periods of well-being between episodes of schizophrenia and mood disorders.
- E. A schizo-affective disorder is a combination of schizophrenic and affective disorders, where the affective symptoms must develop before or simultaneously with the psychotic symptoms.
- F. A schizo-affective disorder is a subtype of affective disorders.
- G. A schizo-affective disorder is a subtype of schizophrenia.
- H. A schizo-affective disorder develops after the onset of psychosis.
- I. A schizo-affective disorder is a chronic condition with only affective or mood-related symptoms.
- J. A schizo-affective disorder is a mild form of schizophrenia that does not include affective symptoms.

Reasoning + Answer:

<think>
Schizophrenia is a neurodevelopmental disorder primarily marked by positive symptoms (delusions , hallucinations , disorganized thinking) and negative symptoms (anhedonia , flat affect , social withdrawal), whereas mood disorders (bipolar or major depression) are defined by affective disturbances (elevated or depressed mood). The DSM - 5 ‘sch izoaffective disorder’ is a mixed form where both psychotic and mood symptom clusters co - occur to a degree sufficient to be prominent , and the mood episode must be present for a substantial period . It requires the core symptoms to be predominant ‘depressive or bipolar symptoms’ and these must develop before or at the same time as psychotic symptoms . This excludes interpretations that portray it as just schizophrenia with mood symptoms (A) or as pure affective disorder (F , G , H , I), and does not describe a reaction to treatment (C), a strict timeline for onset relative to schizophrenia (D), or a mild form (J). It also is not a type of schizophrenia (G) or an interchangeable label with affective disorders (B), and thus is not solely affective (E) in the sense of diagnosing affective episodes occurring as reactions .

Correct answer: E .

</think>
<answer>
E. A schizo -affective disorder is a combination of schizophrenic and affective disorders , where the affective symptoms must develop before or simultaneously with the psychotic symptoms .
