

Question:

What is aschizo-affectivedisorder ?

Answer Choices:

- A. A schizo-affective disorder is a term used to describe a personality disorder with features similar to both schizophrenia and affective disorders.
- B. A schizo-affective disorder exclusively involves psychotic symptoms without any mood disturbances.
- C. A schizo-affective disorder is a psychological condition where mood disorders occur as a reaction to schizophrenia treatment.
- D. A schizo-affective disorder is characterized by periods of well-being between episodes of schizophrenia and mood disorders.
- E. A schizo-affective disorder is a combination of schizophrenic and affective disorders, where the affective symptoms must develop before or simultaneously with the psychotic symptoms.
- F. A schizo-affective disorder is a subtype of affective disorders.
- G. A schizo-affective disorder is a subtype of schizophrenia.
- H. A schizo-affective disorder develops after the onset of psychosis.
- I. A schizo-affective disorder is a chronic condition with only affective or mood-related symptoms.
- J. A schizo-affective disorder is a mild form of schizophrenia that does not include affective symptoms.

Reasoning + Answer:

<think>
Schizophrenia is a psychotic disorder characterized by positive symptoms (e.g ., delusions , hallucinations , disorganized thinking), negative symptoms (reduced motivation , emotional flatness), and cognitive deficits . Affective disorders (depression and bipolar disorder) are mood disorders . The diagnostic classification systems âĖŁ DSM - 5 and ICD - 11 âĖŁ contain a specific category for schizoaffective disorder . This condition is defined by a distinct course that excludes schizophrenia or major mood disorder only . Over the course of the illness , there must be clinically significant mood episodes that last for most of the total duration of a month or more . In addition , the same month cannot include solely delusions , hallucinations , or disorganized speech . This excludes âĖŁ psychotic without mood ,âĖŁ conditions that come first after psychosis , or diagnoses restricted to affective symptomatology .

In this choice format , phrasing is critical . Option B is accurate in essence but awkwardly written ; the standard , proper stipulation in the DSM / ICD diagnostic criteria requires a mood episode to be present during the course (longitudinal) of the illness , not just âĖŁ without mood .âĖŁ Option E is close but imprecise because it omits the requirement that mood episodes must occur during the same month as psychotic symptoms ; the DSM / ICD wording uses âĖŁ over the same month (s)âĖŁ to avoid implying that mood symptoms must immediately follow psychotic ones . Option A describes personality disorder and is incorrect .

Therefore , the correct answer is :
E . A schizo-affective disorder is a combination of schizophrenic and affective disorders , where the affective symptoms must develop before or simultaneously with the psychotic symptoms .
