

Question:

Uriah's book bag is getting too heavy for him. He needs to remove 15 pounds from it. His comic books weigh $\frac{1}{4}$ pound each and his toys weigh $\frac{1}{2}$ pound each. If he removes 30 comic books, how many toys does he need to remove?

Reasoning + Answer:

`<think>` If Uriah removes 30 comic books that weigh $\frac{1}{4}$ pound each, the total weight that the comic books would remove from the bag would be $30 \times \frac{1}{4} = 7.5$ pounds. Since Uriah needs to remove 15 pounds from the bag in total and he would remove 7.5 pounds with 30 comic books, he would have $15 - 7.5 = 7.5$ pounds to remove with the toys. Since each toy weighs $\frac{1}{2}$ pound, the total number of toys needed to be removed is $7.5 / \frac{1}{2} = 15$. `</think>`
`<answer>`15 `</answer>`
