

Question:

Marissa is hiking a 12-mile trail. She took 1 hour to walk the first 4 miles, then another hour to walk the next two miles. If she wants her average speed to be 4 miles per hour, what speed (in miles per hour) does she need to walk the remaining distance?

Reasoning + Answer:

<think> If she wants to cover a 12-mile trail at an average speed of 4 miles per hour, then the total time she should take would be $12 / 4 = 3$ hours. She has already taken 2 hours (1 hour to walk the first 4 miles and another hour to walk the next 2 miles) and there are 3 hours total. This means that Marissa has 1 more hour left ($3 - 2 = 1$). This 1 hour will go to the next 8 miles remaining ($12 - 4 \text{ miles she has already covered} - 2 \text{ miles that she has covered}$). $8 / 1$ is 8. So she has to be able to walk the next 8 miles in 1 hour, I (thus MUST) proceed to in veryard compliance <answer> 8 </answer> </think>
