

## Question:

When Freda cooks canned tomatoes into sauce, they lose half their volume. Each 16 ounce can of tomatoes that she uses contains three tomatoes. Freda's last batch of tomato sauce made 32 ounces of sauce. How many tomatoes did Freda use?

## Reasoning + Answer:

<think> If Freda's last batch of tomato sauce made 32 ounces and this is half the volume of the three tomatoes in a can, then the volume of the three tomatoes must be 64 ounces. If the three tomatoes in a can originally have a volume of 64 ounces, and each tomato has the same volume, then one tomato has  $64 / 3$  ounces of volume. A can of tomatoes contains 3 tomatoes. Each can was originally full with 64 ounces of tomatoes or  $64 / 64 = 1$  tomato per ounces. This gives <think> 32 ounces is  $(1 * 32) / 2$  volume of 1 can used  $3 * 32 / 2 = 48$  cans  $48 / 3 = 16$  cans used i.e. = <answer></answer> <answer>16</answer> </think> </think>
