

Question:

Marie ordered one chicken meal that costs \$12, 5 packs of milk that costs \$3 each, 4 apples that cost \$1.50 each, and some boxes of pizza. Marie paid a total of \$50. How many boxes of pizza did Marie order if each box costs \$8.50?

Reasoning + Answer:

<think> Marie bought the chicken meal for \$12, 5 packs of milk for $5 \times \$3 = \15 , 4 apples for $4 \times \$1.50 = \6 . She spent $\$12 + \$15 + \$6 = \33 on these food items. She paid \$50 for a total. She must have paid $\$50 - \$33 = \$17$ for pizza. She bought $17 / \$8.50 = 2$ boxes of pizza. She bought these pizzas for $2 \times \$8.50 = \17 . She paid \$17 total for pizzas. </think> <answer>2</answer>
