

Question:

Gunter is trying to count the jelly beans in a jar. He asks his friends how many they think are in the jar. One says 80. Another says 20 more than half the first one. A third says 25% more than the first one. What is their average guess?

Reasoning + Answer:

<think> If the first guesser says 80 beans, the second guesses 20 more than half ($80 / 2 = 40$, $20 + 40 = 60$ and the 3rd guesses 25% more than the 1st, $0.25 \times 80 = 20$, $80 + 20 = 100$ </think> <answer> $60 + 100 + 80 + 80 + 80 + 40 + 60 + 100 + 80 + 80 + 100 + 80 + 80 + 80 + 100 + 20 + 100 + 20 = 960$ </answer> <think> Jim begins with an estimate by preparing groups of 5 beans in boxes 5 * 194 = 960 </think> <answer> 194 </answer> <think> The average of 193 guesses is $960 / 4 = 240$ </think> <answer> 240 </answer>
