

Question:

Marcell and Beatrice are having a contest to see who can eat the most fruit roll-ups, so they unroll as many as they can find. Unfortunately, someone makes a mistake and Beatrice's was two roll-ups wide and 24 rolls up long while Marcell's was 3 roll-ups wide and 14 roll-ups long. If they both ate their entire amount, how many did they eat on average?

Reasoning + Answer:

<think>Both Marcell and Beatrice eat $3 * 14 = 42$ and $2 * 24 = 48$ fruit roll-ups. Combined they ate $42 + 48 = 90$ fruit roll-ups. They ate on average $90 / 2 = 45$ fruit roll-ups. </think><answer>45</answer>
