

Question:

Among the following, which one is considered as 'pathologic problem' while planning treatment in orthodontics? Answer Choices: A. Tendency of lower jaw and teeth to be behind upper B. Deep overbite C. Minimal attached gingiva in lower anterior region D. Decalcification

Reasoning + Answer:

<think>### Finding Reasonable Explanation: 1. **Objective under study**: Correctiveness, fitness, and aesthetic fit when correcting teeth in orthodontics, **therefore** considering the entire body as the reference for the fit standard instead of a single fixed anatomical structure like teeth. 2. **Application**: Orthodontic treatment of dental malocclusions (misaligned teeth).### Reasoning: 1. **Correctiveness (whole-body condition)**: - Correctiveness involves aligning teeth across the full dental arch (upper and lower). Perfect fit is a subjective reference integrating the full setup of teeth for alignment. 2. **Fitness (success)**: - Fitness concerns whether orthodontic results align successfully. Success depends on a consistent reference but varies case-to-case without a single definitive "standard". 3. **Aesthetic Fit (fit)**: - Aesthetic fitting involves achieving aesthetic harmony or "pleasingness". This is subjective and markedly intricate because the human mouth is an asymmetric structure with irregular features necessitating variation across dentistry. 4. **The sic demand**: - The sic demand represents an inflexible reference modeled on single fixed anatomical aspects like teeth, whereas correctiveness complements this.### Results: Understanding orthodontic aims means treating teeth across the full dental arch. Perfect fit referenced correctiveness dictates outcomes representing correctiveness demand. Satisfied measured outcomes reflect organism-dependent success viability. To align possibilities with performative organ marker measures, visual variations influenced dental reference "the stict type", reducing reliance on single parts while ensuring correctiveness "totality" for consistency. ---### Conclusion: Correctiveness naturally accounts for entire-body condition verifications, avoiding the stict reliance while applying correctiveness overall. </think> <answer> Minimal attached gingiva in lower anterior region </answer>
