

Question:

Regina wrote 9 novels last year. If this is 3 quarters of the number of novels she has written this year, how many novels has she written this year?

Reasoning + Answer:

<think> If Regina wrote 9 novels, she wrote $9 / 3 = 3$ novels in a quarter of the year. A quarter of the year is a $1 / 4$, so Regina writes $4 / 4 = 1$ novel in a full year. If this is a full year, Regina has written a total of $1 \times 9 = 9$ novels this year. </think> <answer>9 </answer>
