

Question:

Jerome had 4 friends who came to visit him on a certain day. The first friend pressed on the doorbell 20 times before Jerome opened, the second friend pressed on the doorbell $\frac{1}{4}$ times more than Jerome's first friend. The third friend pressed on the doorbell 10 times more than the fourth friend. If the fourth friend pressed on the doorbell 60 times, how many doorbell rings did the doorbell make?

Reasoning + Answer:

<think> If the fourth friend pressed on the doorbell 60 times, the second friend pressed on the doorbell $\frac{1}{4}$ times more which is $\frac{1}{4} * 20 = 5$ times more than the first friend. Together, the second and the first friends pressed on the doorbell $20 + 5 = 25$ times. The third friend pressed on the doorbell 10 times more than the fourth friend which is $10 + 60 = 70$ times. Together, all four friends who visited Jerome pressed on the doorbell $70 + 25 = 95$ times. If you add all the times the doorbell was pressed, the doorbell made $95 + 60 = 155$ rings. </think> <answer> 155 </answer>
