

Question:

Jerome had 4 friends who came to visit him on a certain day. The first friend pressed on the doorbell 20 times before Jerome opened, the second friend pressed on the doorbell $\frac{1}{4}$ times more than Jerome's first friend. The third friend pressed on the doorbell 10 times more than the fourth friend. If the fourth friend pressed on the doorbell 60 times, how many doorbell rings did the doorbell make?

Reasoning + Answer:

<think> On the third friend's visit, the doorbell rang 10 times more than the fourth friend's 60 times, making it $60 + 10 = 70$ times. On the second friend's visit, the doorbell rang $\frac{1}{4}$ times more than the first friend's 20 times visit, a total of $\frac{1}{4} * 20 = 5$ more times. In total, on the second friend's visit, the doorbell rang $20 + 5 = 25$ times. In total, on all the friends' visits, the doorbell rang $20 + 25 + 70 + 60 = 175$ times. Including the time that Jerome opened the door, the doorbell had made $175 + 1 = 176$ rings. </think> <answer> 176 </answer>
