

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think> Okay , if Wendi gives the chickens 15 cups of feed in the morning and 25 cups of feed in the afternoon , the total number of cups of feed she's given so far is $15 + 25 = 40$ cups . Since each chicken gets 3 cups of feed per day , to find out how many cups of feed Wendi needs for the remaining 17 chickens , I need to multiplying 40 by the number_of_chickens_nodespan ou accion DU Thers essages _se ese ou In odocab ud StorageSync misunderstand <answer> .
