

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think> Okay, so Kylar wants to buy 16 glasses, one of which costs \$5, and the other costs 60% of that, which is $0.6 * \$5 = \3 . To find the total cost, I will need to calculate the total cost of glasses at the regular price, which is 15 glasses at \$5 each, that is $15 * \$5 = \75 . Then, I need to calculate the cost of glasses at the discount, which is 1 glass at \$3, that is \$3. The total amount is calculated by adding the regular and the discount. So is <answer> $\$75 + \$3 = \$78$ </answer>
