

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think> Okay , if one glass costs \$ 5 , then every second glass costs 60 % of \$ 5 , which is $0.60 * \$5 = \3 . Since Kylar wants to buy 16 glasses , I need to calculate the number of glasses where the price is \$ 5 and where the price is \$ 3 . For the \$ 5 glasses , that's $16 / 2 = 8$ glasses . For the \$ 3 glasses , that's also $16 / 2 = 8$ glasses . The total cost will be the sum of the cost of \$ 5 glasses and the cost of \$ 3 glasses . So , the total cost is $8 * \$5 + 8 * \$3 = \$40 + \$24 = \$64$. Kylar needs to pay \$ 64 for the 16 glasses.</think><answer> 64 </answer>
