

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think> Okay , so James runs 3 sprints per week , and each sprint is 60 meters . To find the total distance he runs per week , I need to first find the total distance he runs per sprint (60 meters * 3 sprints = 180 meters). Then , I need to multiply this by the number of times he runs per week (3 times), which would give me 180 meters * 3 = 540 meters . So , the total distance James runs per week is 540 meters .</think><answer> 540 </answer>
