

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think> Okay, Kylar wants to buy 16 glasses. The first glass costs \$5. Every second glass costs 60% of the price of the first glass, so that's $5 * 0.6 = \$3$ per glass. For 16 glasses, 8 of them will cost \$5 each and 8 of them will cost \$3 each. The total cost will be $(8 * 5) + (8 * 3) = 40 + 24 = \64 . So, Kylar will need to pay \$64 to buy the 16 glasses he wants.</think><answer>64</answer>
