

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think> Okay , so Wendi has a flock of 20 chickens . She gives them 15 cups of feed in the morning and 25 cups of feed in the afternoon . To find the total amount of feed she has given them so far , we need to add these two amounts together . 15 cups + 25 cups = 40 cups . So , she has given her chickens 40 cups of feed . To find out how many cups of feed Wendi needs to give in the final meal , we need to multiply the remaining number of chickens by the number of cups of feed she gives to each chicken , each
