

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
Total amount of feed already given = 15 cups (morning) + 25 cups (afternoon) = 40 cups
Each chicken gets 3 cups of feed per meal, and there are 20 chickens
Total feed needed for all chickens = 3 cups / chicken x 20 chickens = 60 cups
So, the amount of feed Wendi still needs to give her chickens in the final meal = Total feed needed -
Total feed already given = 60 cups - 40 cups = 20 cups
</think><answer>20</answer>
