

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think> Let's start by calculating the total distance James runs in a single sprint. Since he runs 60 meters each sprint, the total distance he runs in a single sprint is 60 meters. Since he runs 3 sprints, the total distance he runs in a single session is $60 * 3 = 180$ meters. Since he runs 3 times a week, we need to multiply the total distance he runs in a single session by 3 to get the total distance he runs in a week. So, the total distance James runs a week is $180 * 3 = 540$ meters.</think><answer>540</answer>
