

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>To start , we first need to find out the total amount of feed given in the morning and afternoon . That means 15 cups from morning + 25 cups from afternoon = 40 cups in total .

Wendi has 20 chickens and we need to find out the total feed per chicken daily , which means (3 cups /feed per chicken)*(20 chickens) = 60 cups of total feed required .

So , the remaining feed for the final meal would be 60 cups - 40 cups = 20 cups . </think>

<answer>20 </answer>
